Object Oriented Programming

- OO-programming allows you to build large systems reliably
- In the OO-methodology you separate the interface from the implementation.
- The interface is the public methods (functions) of a class
- The implementation is hidden (encapsulated) and may be changed without affecting how the class is used
- There exist other ways of programming, but C++ is designed to support the OO-methodology—for building systems it is brilliant

Object-Oriented Classes

BIOM200

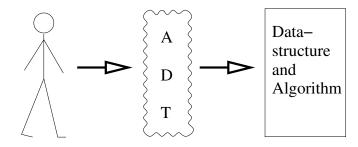

Further Mathematics and Algorithms

Abstract Data Types

Further Mathematics and Algorithms

- With data structures there are some traditional interfaces called Abstract Data Types or ADTsI
- These are implementation free data structures
- They are mathematical abstractions of the data structure
- Their purpose is to allow you to declare you intentions
- You are entering into an agreement that you only intend to use the underlying data structure in the way specified by the interface.

ADTs

BIOM200

Further Mathematics and Algorithm

Say it with an ADT

- Common ADTs include stacks, queues, priority queues, sets, multisets and maps
- There are many possible implementations of these ADTsI (some far from obvious)
- Each ADT has a limited set of methods associated with it
- They are an abstraction away from the implementation
- By declaring your intentions you are making your code easier to understand and maintain!

cs and Algorithms

BIOM200

Further Mathematics and Algorith

• Last In First Out (LIFO) memory • Standard functions * push (item) * T top() * T pop() except in C++ pop() doesn't return the top of the stack * boolean empty()

Stacks

Stacks reduces the access to memory—no longer random access

Why Use a Stack?

- Seems counter intuitive to reduce what you can do
- Gives you a very simple interface
- Prevents another programmer from using memory in a way that will break existing code!
- Sufficient for large number of algorithms

Uses of Stacks

Evaluating Arithmetic Expressions

• Reversing an array

linked-list)■

• Parsing expression for compilers

• Implemented using an array! (or a

- ⋆ balancing parentheses
- ★ matching XML tags
- ⋆ evaluating arithmetic expression
- Clustering algorithm

 $(((7+3)/5)*(7-5)) X/5)*(7-5)) X^*(7-5)) X^*(7-$

Outline

• First-in-first-out (FIFO) memory model

- 1. Abstract Data Types (ADTs)
- 2. Stacks

BIOM200

- 3. Queues and Priority Queues
- 4. Lists, Sets and Maps
- 5. Putting it Together

• peek()Ⅰ

• enqueue(elem)

• dequeue()

• C++ has a double ended queue (deque) with push_front(), push_back(), etc.

Queues

F E D C B

OM2005 Further Mathematics and Algorithms 1

Uses of Queues

Queues are heavily used in multi-threaded applications (e.g. operating systems)

- Multi-threaded applications need to minimise waiting and ensure the integrity of the data structure (for instance when an exception is thrown)
- Because of this they are more complicated than most data structures
- They can be implemented using linked-lists or circular arrays

Priority Queues

- Queue with priorities
- insert (elem, priority) (in C++ push ())
- findMin() (in C++ top())
- deleteMin() (in C++ pop())

B 5 D 4 A 3 deleteMin()

BIOM20

Further Mathematics and Algorithms

Uses of Priority Queues

- Queues with priorities (e.g. which threads should run)
- Real time simulation
- Often used in "greedy algorithms"
 - ★ Huffman encoding
 - ⋆ Prim's minimum spanning tree algorithm

• Could be implemented using a binary tree or linked list

Implementation of Priority Queue

- Most efficient implementation uses a heap
- A heap is a binary tree implemented using an array

BIOM2005 Further Mathematics and Algorithms 1

Lists

Outline

- Abstract Data Types (ADTs)
- 2. Stacks
- 3. Queues and Priority Queues
- 4. Lists, Sets and Maps
- 5. Putting it Together

• In C++ the standard list is known as vector<T>

- That is, it is a collection where the order in which you put items into the list counts
- You can have repetitions of elements
- It has random access, e.g. v[i]■
- You can push_back(i), insert, erase, etc.
- C++ has a linked list class List<T>

IOM2005 Further Mathematics and Algorithms 1

BIOWIZ

Further Mathematics and Algorithms

Sets

- Models mathematical sets
- Container with no ordering or repetitions
- Methods include insert, find, size, erase
- Provides fast search (find)
- This is the class to use when you have to rapidly find whether an
 object is in the set or not—don't use a list like vector<T>!

BIOM2005 Further Mathematics and Algorithms

Iterators

- Wish to act on all members of the set
- ullet Performed using an iterator
- Iterators are used by many collections
- \bullet In C++ iterators follow the pointer convention

```
set<string> words;
words.insert("hello");
words.insert("world");

for(auto iter = words.begin(); iter != words.end(); ++iter) {
   cout << *iter << endl;
}</pre>
```

BIOM200

Further Mathematics and Algorithms

Implementation of Sets

- Sets are very important and there are many implementations depending on their usage!
- Two common implementations of sets are
 - * hash tables: unordered_set<T>
 - ★ binary trees: set<T>
 ■
- Which is most efficient depends on the application
- Binary trees allow you to iterate in order[(iterating over a hash table will give you outputs in random order)]
- multiset<T> are sets with repetition

Maps

- A map provides a content addressable memory for pairs keyword: data
- It provides fast access to the data through the keyword
- Implement as tree or hash table
- Multimaps allows different data to be stored with the same keyword

Outline

- 1. Abstract Data Types (ADTs)
- 2. Stacks
- 3. Queues and Priority Queues
- 4. Lists, Sets and Maps
- 5. Putting it Together

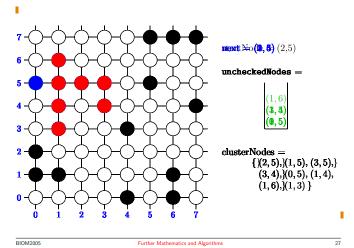

- A frequent problem is to find clusters of connected cells
- Applications in computer vision, computer go, graph connectedness, . . .

005 Further Mathematics and Algorithms

Connected Nodes

Lessons

- Abstract Data Types (ADT) are interfaces to data
- Their purpose is to allow the programmer to declare their intentions.
- They often have different implementations with different properties
- The most efficient implementation is not always obvious—we will see many of these implementations as we go through this course
- You need to know the common ADTs (e.g. Stack, Queue, List, Set, Map) and how and when to use them

Connected Nodes

26

Connected Node Algorithm

```
set<Node> findCluster(Node startNode, Graph graph)
{
  stack<Node> uncheckedNodes = new Stack<Node>();
  set<Node> clusterNodes = new HashSet<Node>();

  uncheckedNodes.push(startNode);
  uncheckedNodes.add(startNode);

  while (!uncheckedNodes.empty()) {
    Node next = uncheckedNodes.top(); uncheckedNodes.pop();
    vector<Node> neighbours = graph.getNeighbours(next);

    for (Node neigh: neighbours) {
        if (graph.isOccupied(neigh) && !clusterNodes.contains(neigh) ) {
            uncheckedNodes.push(neigh);
            clusterNodes.insert(neigh);
        }
    }
}

    return clusterNodes;
}
```
